"Peroxisome assembly factor 1: nonsense mutation in a peroxisome-
deficient Chinese hamster ovary cell mutant and deletion analysis."

MOI. Cell. Biol. 14:5458-5455(1994).

-I- FUNCTION: SOMEWHAT IMPLICATED IN THE BIOGENESIS OF PEROXISOMES.

-I- SUBCELLULAR LOCATION: Integral membrane protein. Peroxisomal.

-I- SIMILARITY: CONTAINS 1 RING-TYPE ZINC FINGER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TRANSMEM

FUNCTION: COULD BE A MELANOGENIC ENZYME. COULD REPRESENT AN ONCOFETAL SELF-ANTICEN THAT IS NORMALLY EXPRESSED AT LOW LEVELS QUIESCENT ADULT MELANOCYTES BUT OVEREXPRESSED BY PROLIFERATING USEANTAL MELANOCYTES BUT OVEREXPRESSED BY PROLIFERATING NEONATAL MELANOCYTES AND DURING TUMOR GROWTH. RELEASE OF THE SOLUBLE FORM, ME20-S, COULD PROTECT TUMOR CELLS FROM ANTIBODY MEDITATED IMMUNITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SOFT TO DESCRIPTION OF THE TWO RESERVED TO THE PROPERTY OF THE PYRUVATE DEHYDROGENASE COMPLEX.

-!- CARALYTIC ACTIVITY: [Pyruvate dehydrogenase (lipoamide)] + phosphate + H(2)0 = [pyruvate dehydrogenase (lipoamide)] + phosphate.
-!- COFACTOR: MAGNESIUM.
-!- SUBUNIT: HETERODIMER OF A CATALYTIC SUBUNIT AND A FAD PROTEIN OF UNKNOWN FUNCTION (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Mitochondrial matrix.
-!- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN LIVER.
-!- SIMILARITY: BELONGS TO THE PP2C FAMILY. SMART; This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial Huang B., Gudi R., Wu P., Harris R.A., Hamilton J., Popov K.M.;
"Isoenzymes of pyruvate dehydrogenase phosphatase. DNA-derived amino acid sequences, expression, and regulation.";
J. Biol. Chem. 273:17680-17688(1998).
-i- FUNCTION: CATALYZES THE DEPHOSPHORYLATION AND CONCOMITANT REACTIVATION OF THE ALPHA SUBUNIT OF THE El COMPONENT OF THE PARTY PA PROSITE; PSU1034; FF40, 1.

Hydrolase; Mitochondrion; Transit peptide; Magnesium.

TRANSIT 1 67 MITOCHONDRION (POTENTIAL).

J. Biol. Chem. 275:31128-31133(2000).
                                                                                                                                                                                                                                                                                                                                                                                      DEVELOPMENTAL STAGE: Present in serum and placenta pregnancy; levels increase throughout pregnancy. INDUCTION: By 8-bromoadenosine-3', 5', phosphate. PTM: There appear to be no free cysteinyl groups. SIMILARITY: CONTAINS 4 SUSHI (SCR) DOMAINS. SIMILARITY: BELONGS TO PEPTIDASE FAMILY M46.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  predominantly found as a disulfide-linked 2:2 heterotetramer with the proform of PRG2.
SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: High levels in placenta and pregnancy serum. In placenta, expressed in X cells in septa and anchoring villi, and in syncytiotrophoblasts in the chorionic villi. Lower levels are found in a variety of other tissues including kidney,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   myometrium, endometrium, ovaries, breast, colon, fibroblasts and osteoblasts

                                 derived mast cells.";

J. Immunol. 152:4508-4515(1994).

-I- FUNCTION: RECEPTOR FOR ADENOSINE. THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE ADENYLYL CYCLASE.

-I- SUBCELLULAR LOCATION: Integral membrane protein.
-I- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DOMAIN
